

# DATA XRAY

## CONTRACT SEARCH

Quick, efficient contract search. Data intelligence to get to the answers to your legal questions right now.

### Prompt, accurate answers

The Data X-Ray will read your contract contents and pull out the parts that are relevant to the questions you need answers to. Simply search directly from your native storage or upload your files to Data X-Ray managed storage in a drag and drop experience ([xray.ohalo.co](http://xray.ohalo.co)). There is no requirement to integrate your contracts with any independent systems.

### Automatically sort all documents by counterparties or signatories

The Data X-Ray understands which documents are relevant to which counterparties and allows you to find relevant documents with those counterparties in seconds. The Data X-Ray also identifies named persons in documents allowing you to quickly find individual signatories to agreements.

### Automatically label files according to document type

The Data X-Ray's machine-learning powered document categorization features allow you to differentiate between document types that you define. This allows you to quickly drill down into which documents are commercial agreements, MSAs, NDAs, and whatever else you might define.

# CONTRACT SEARCH IN PRACTICE

A powerful solution for use cases including counterparty identification, contract discovery, clause identification and more

Contracts are often stored in disorganized folders on multiple network drives or cloud storage. Legal and contracts teams often have little idea of who the contracts are with or whether or not they even still have effect.

The Data X-Ray transforms weeks-long contract search processes into minutes with a "Google-like" search capability. The Data X-Ray automatically keeps track of the data that your contracts team cares about like counterparties, dates, and key clause types. This is all indexed and searchable in seconds so that you can pull back the contracts that matter to the particular case at hand and get to the analytics that drive value for your organization.

## Clause discovery exercises

Answering questions like “what SLA clauses are we exposed to?”, “what security requirements do we have with our clients?”, and “with which clients can we uplift pricing?” used to require manual search through thousands if not hundreds of thousands of files across different areas of your organization.

The Data X-Ray can scale to millions of files to discover data that is relevant to you within your file systems—and do this in a fraction of the time it takes humans to do the same. The Data X-Ray’s machine learning algorithms can parse and understand your files to differentiate between what is and is not important for a particular question that you are trying to answer.

## Legal document type identification

In an unstructured file system, finding documents that you need is difficult. Inconsistent file names and lack of understanding of colleagues’ file storage structure can cause you to overlook relevant files that put your organization at legal risk. The Data X-Ray can quickly parse which files are of what type to help you sort between NDAs, MSAs, and whatever else you might define as important to your work.
